74V13753A0106	Information	Wednesday, February 11 2026, 04:05:09 p.m. IST

Insight logs notification like link up/down of the switch , it logs this message by reading from logging buffered of switch using **openapiBufferedLogEntryNextGet** stores the logs tmp/insight_log.

readLine will read each line and checks if it has many string in log_list (like link up/down) and sends notifications.

Also uses **openapiEventRegister** will call **syncddbTableChangeNotify** to get notification if particular table is changed .Insight registers to **OPEN_EVENT_CONFIG** table , to get notification if any configuration is saved or clear in the switch (from Local GUI / CLI). Uses **openapiEventWait** to wait for any configuration changes and if configuration change notification is received ,**instant monitoring** flag is set and monitoring thread is triggered and all the APIs are called from insight and switch replies for all the APIs and any changes in the data is updated.
